

Architecture Flow Comparison: Old (Whiteboard) vs. Proposed New Flow

System: TicketX / AutomationX Platform (Architecture Evolution Report)

Objective: Executive side-by-side evaluation demonstrating whiteboard gaps and new enterprise value.

Version 3.6.0 Enterprise Evolution

1. Side-by-Side Visual Flow Comparison

● Old Baseline Flow (Whiteboard Sketch)

Weaknesses: Operators blind to AI context; AI lacks technical KB; resolved cases lost in raw DB.

● Proposed New Flow (Unified Platform)

Advantages: 3-layer central KB, CRM AI Copilot drafting, and closed-loop continuous learning.

2. Detailed 6-Dimension Comparison Matrix

Dimension	Old Flow (Whiteboard Baseline)	Proposed New Flow	Value & Code Evidence
1. Knowledge Source	Unspecified (Floating arrow) AI restricted to basic heuristics	Unified 3-Layer KB 1. SOP RAG 2. Git Codebase Search 3. Knowledge Graph	AI resolves system errors down to code level. <i>(KnowledgeService.ts, graphify)</i>
2. CRM → AI Integration	Disconnected Silo Agents blind to AI thoughts & prior context	Connected via AI Copilot Displays AI Insights & provides "Draft with AI" button	Operators understand context instantly; 3x faster resolution
3. Agent Lookup Tools	None Agents search external tabs manually	Embedded Knowledge Panel Direct SOP/Code search in CRM	Single Pane of Glass for all operations
4. AI Continuous Evolution	Static AI Human resolutions lost in raw DB	Closed-Loop Learning One-click solution ingestion to KB	AI intelligence compounds with every case
5. Outbound Message Flow	Collision Risk Bot and human replies collide	AutomationX Gatekeeper Deterministic 15-min takeover lease	100% collision-free customer delivery
6. Dev Team Sync	No external sync	Bidirectional Plane.so Sync Auto-creates tickets & syncs states	Seamless Support to Engineering lifecycle

3. The 3 Real Knowledge Layers in the Codebase

Layer	Repository & Schema Evidence	Functional Capability
Layer 1: Document & SOP RAG	KnowledgeAgent.ts, knowledge_documents, knowledge_embeddings	Semantic similarity lookups for system manuals, policies, and Error 506 catalog.
Layer 2: Git Codebase Search	SearchCodebaseTool.ts, GitSyncService.ts, project_git_repositories	Extracts line-by-line code evidence (FilePath, line range, commit SHA).
Layer 3: Knowledge Graph	graphify-out/ (20,000+ Nodes, 24,000+ Edges)	AST cross-file relationships, community structures, and god nodes.
